

# Agenda

- Task is to segment the Telcom users market
- Exploratory Data Analysis
- Collinearity Removal
- Elbow Analysis
- Clustering
- Profiling
- Product Recommendations

# Problem Statement

Market segmentation enables companies to better serve customers by identifying and marketing different products and services to different consumer sets. In this problem, following task were to achieve:

- **Segmentation** of the Customers
- Presentation of segments **visually** in detail
- Suggestion of various **Campaigns** which can be thrown to specific clusters.

# Assumptions

- Number of **Observations**: 100
- Number of **Variables**: 474
- Sample of 100 Rows isn't significant.
- However due to availability of the Data, it is being considered as a significant sample.
- **Data Analysis** and **Clustering** is done on the basis of Data Sample of 100 observations

# Few **insights** from the Data

**Most of the users are call users**

**Most of the Calls are being done at Evening Time**

**Usage of SMS is in greater in Day Time**

**95% of the revenue is generated by Calls\***

\*Stats of PTA's reports are different (70% are call users and 30% are SMS and internet users)

Number for SMS in various shifts

Revenue Comparison

Amount of Calls in Night  
(1,688)

Amount of Calls in Evening  
(7,355)

Amount of Calls  
in Day time  
(6,998)

Number of Calls in various shifts

# System Architecture

## READING AND CLEANING THE GIVEN DATA

## SEGMENTATION THROUGH K MEANS CLUSTERING & VISUALIZATION OF SEGMENTS

## RESULTS FOR DATA VISUALIZATION & SEGMENTATION

DATASET USED FOR THE SYSTEM: TELNOR SAMPLE DATA  
OBSERVATIONS: 100

# Data Preprocessing Steps

- Exploratory Data Analysis
- Outliers Detection
- Variables with constant values (0) were removed  
(Variables: 381)
- Correlation matrix generated (381\*381)
  - Removed collinearity at a cutoff value of 0.9
  - Removed the variables with NA values

Covariance Matrix of Variables

- New dataset formed and ready for elbow analysis (variables: 143)
- Standardization was done with min max Normalization (0-1)

# INTRODUCTION- What is clustering?

**Clustering** is the classification of objects into different groups, or more precisely, the partitioning of a data set into subsets (clusters), so that the data in each subset share some common trait.

K-Means Clustering is chosen in our problem to affectively identify the segments/clusters for checking the behavior of customers as well as visualization of segments.

# K-MEANS CLUSTERING

- K-means clustering is used which is an algorithm to classify or to group the objects based on attributes/features into K number of groups.
- K is a positive integer number.
- The grouping is done by minimizing the sum of squares of distances between data and the corresponding cluster centroid.

# Elbow Analysis for optimal number of K

**Elbow method** is followed to validate the number of clusters. Elbow method ran k-means clustering on the data for a range of values of  $k$  (from 1 to 10), and for each value of  $k$  calculated the sum of squared errors (SSE).

# K-Means Clustering Algorithm

- **Step 1:** Begin with a decision on the value of  $k = 4$  (number of clusters from Elbow Analysis) .
- **Step 2:** Placed an initial partition that classifies the data into  $k$  clusters. Assigned the training samples by the following steps:
  1. Took the first  $k$  training samples as single - element clusters
  2. Assigned each of the remaining  $(N-k)$  training samples to the cluster with the nearest centroid. After each assignment, recomputed the centroid of the gaining cluster.

# K-Means Clustering Algorithm contd..

- **Step 3:** Took each sample in sequence and compute its distance from the centroid of each of the clusters. If a sample is not currently in the cluster with the closest centroid, switched this sample to that cluster and update the centroid of the cluster gaining the new sample and the cluster losing the sample.
- **Step 4 .** Repeated step 3 until convergence is achieved, that is until a pass through the training sample causes no new assignments.
- After implementation of K-Means on the dataset, we get this cluster representation

# Clusters from K-means Clustering Algorithm on given Data

# Segments of Users

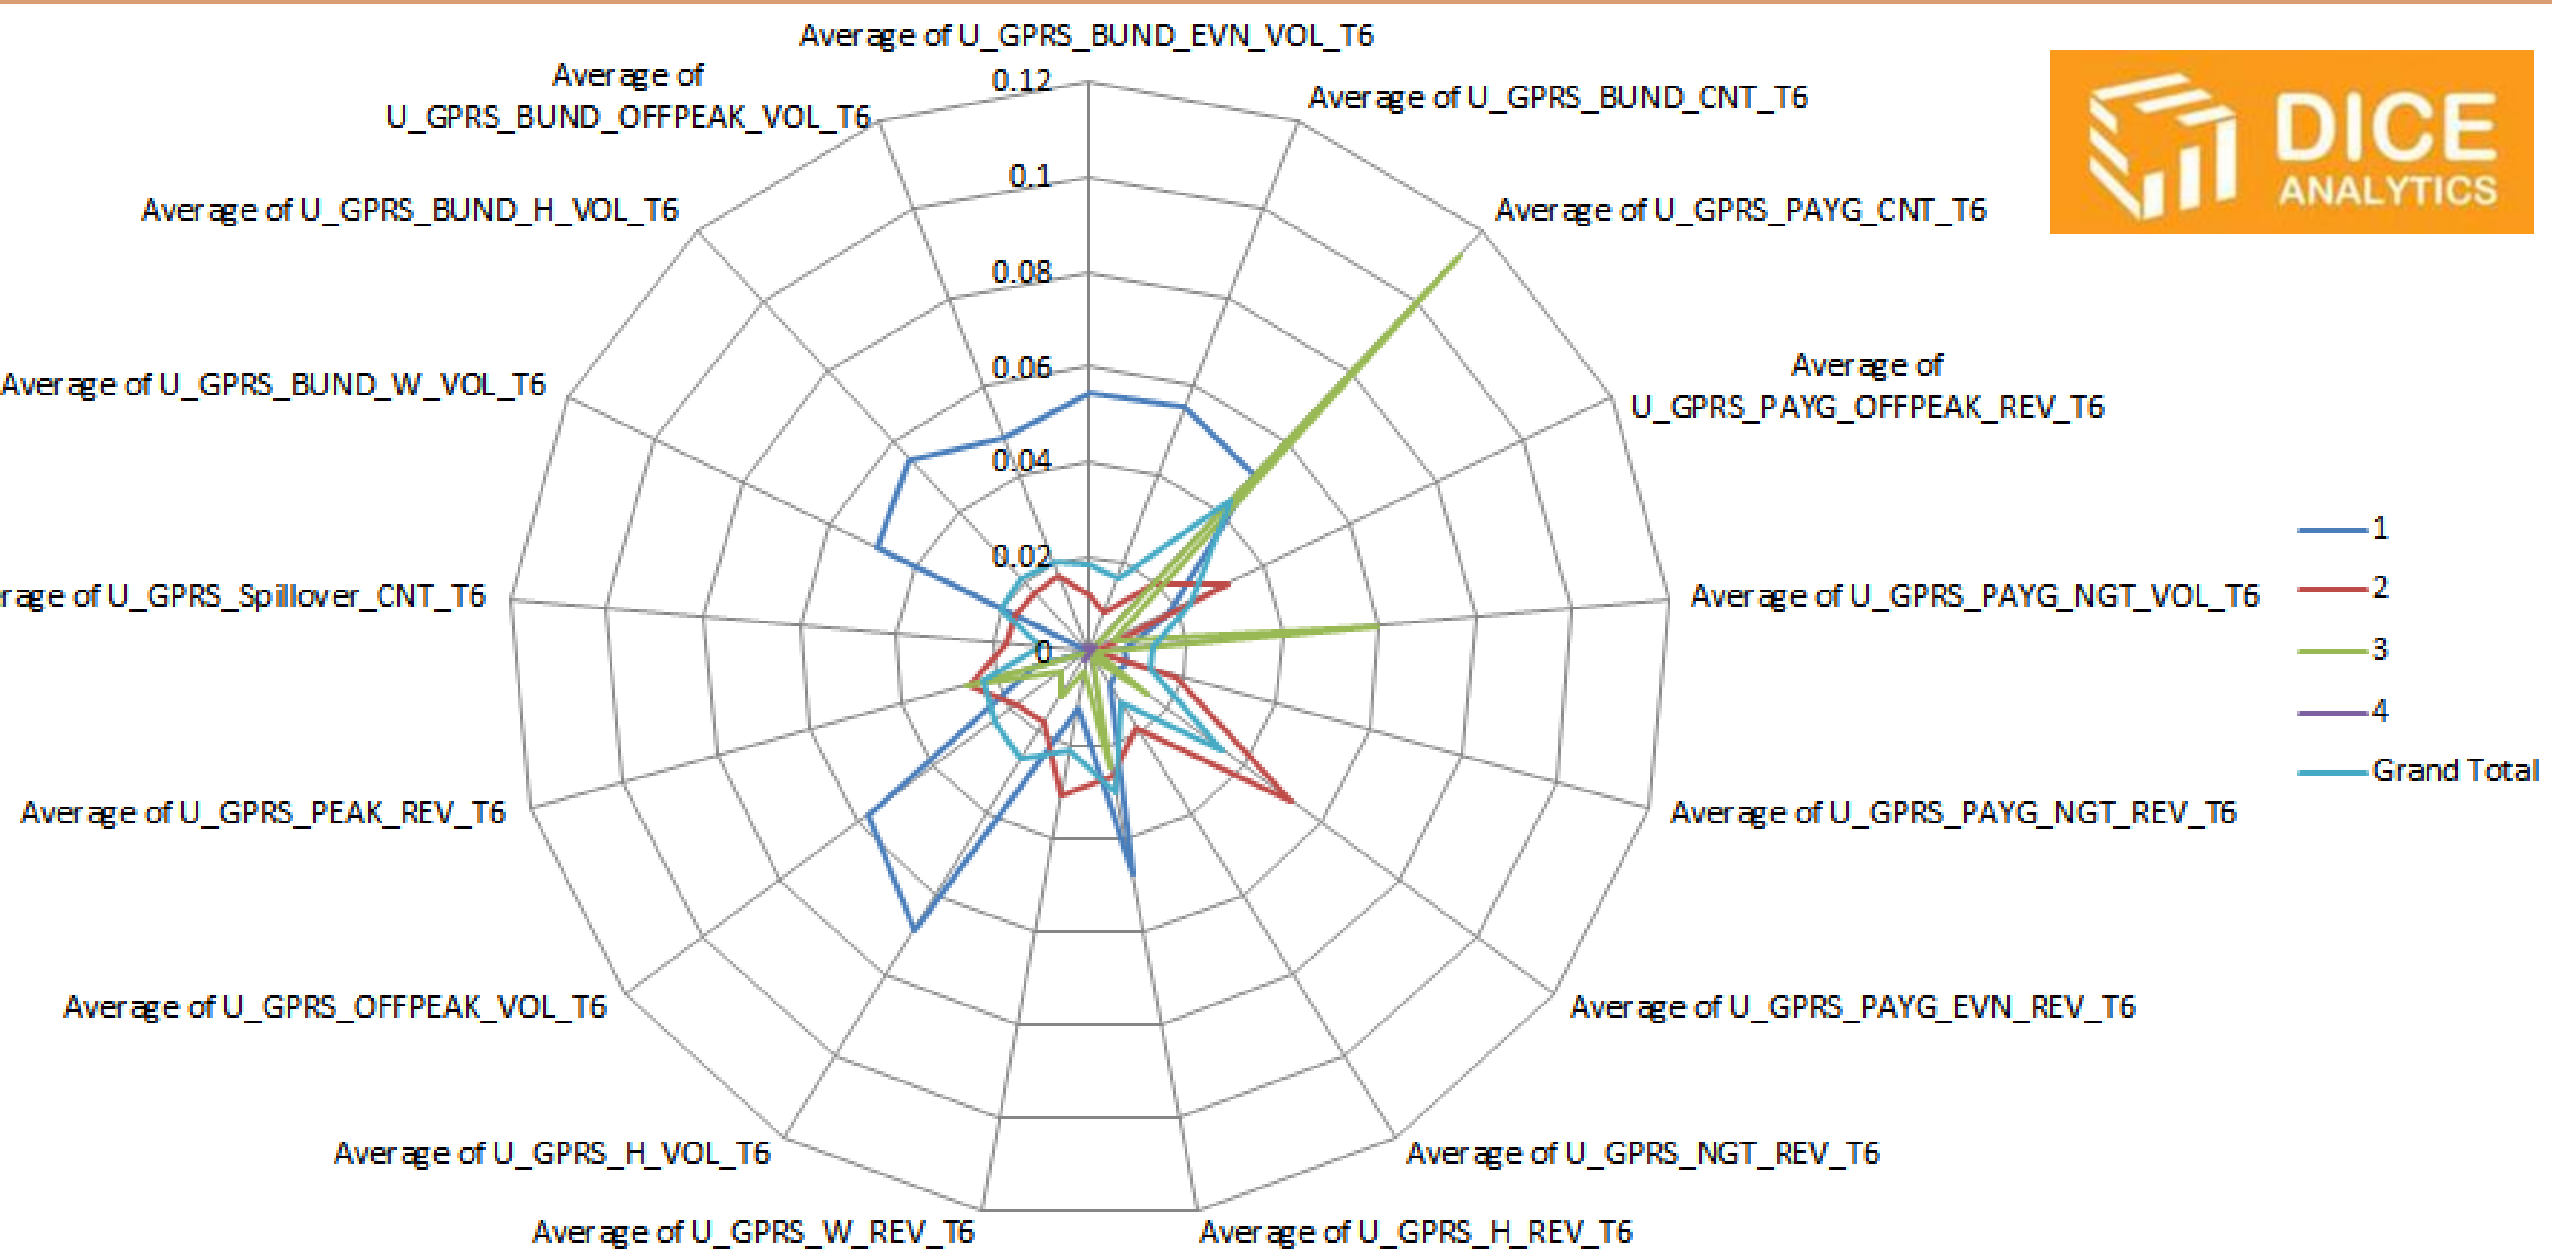

# Segments Details

In order to read and understand the clusters, all features are separated from each other. Mainly three segments were found which were creating impact.

1. Out Bound Features
2. In Bound Features
3. Internet Features

Visualization for **Internet Features**

Visualization for Out bound Features

# Description of Segments

## Out Bound Features

### Cluster 1

Outbound usage of voice calls in evening is low  
 Outbound usage of voice calls in night is low  
 Outbound duration of off net voice calls in evening is low  
 Outbound usage of voice calls during peak times is low  
 Outbound usage of on-net voice calls duration is moderate

### Cluster 2

Outbound usage of voice calling circle count at peak hours is low  
 Outbound usage of voice calls in night is low  
 Outbound duration of on net voice calls in day is low  
 Outbound usage of off net voice calls in week days is low  
 Outbound usage of FNF voice calls duration on week days is low

### Cluster 3

Outbound usage of off net helpline voice calls counts is low  
 Outbound usage of off net call counts on week days is low  
 Outbound usage of voice calls to UAE is low  
 Outbound usage of voice calls during peak times is moderate  
 Outbound usage of voice call on day count and it's revenue is low

### Cluster 4

Outbound usage of off net helpline voice calls counts is high  
 Outbound usage of voice calls in evening is high  
 Outbound usage of off net week days voice call counts is high  
 Outbound usage of voice calls during peak times is high  
 Outbound usage of off net evening voice calls duration is high

**Heavy Off net Outbound Users**

## Internet Features

### Cluster 1

Usage of internet bundle during evening is low  
 Usage of internet helpline and revenue is low  
 Usage of internet in peak time and revenue is low  
 Usage of internet helpline volume consumption is low  
 Usage of internet on week days is low

### Cluster 2

Usage of internet bundle during evening is low  
 Usage of internet for Pay as you go during off peak is low  
 Usage of internet for Pay as you go during evening is low  
 Usage of internet for Pay as you go during night is low  
 Usage of internet bundle for Pay as you go during day is low  
 Usage of internet helpline on week days is low

### Cluster 3

Usage of internet for Pay as you go is low  
 Usage of internet for Pay as you go in night is low  
 Usage of internet for Pay as you go in evening is low  
 Usage of internet helpline revenue is low  
 Usage of internet helpline during peak time revenue is low

### Cluster 4

Usage of internet bundle during evening is too low  
 Usage of internet for Pay as you go during off peak revenue is low  
 Usage of internet helpline volume is very low  
 Usage of internet helpline volume is very low  
 Usage of internet during night is too low

**Limited Internet Users**

## In Bound Features

### Cluster 1

Inbound usage of on net peak SMS is low  
 Inbound usage of SMS count is high  
 Inbound usage of off net Warid call count is low  
 Inbound usage of off net voice call count is high  
 Inbound usage of off net SMS count is high

### Cluster 2

Inbound usage of SMS count is low  
 Inbound usage of Day Voice Call count is low  
 Inbound usage of on net Day Voice Call count is low  
 Inbound usage of peak voice call count is low  
 Inbound usage of on net Day Voice Call count is low

### Cluster 3

Inbound usage of on net Day Voice Call count is high  
 Inbound usage of off net Voice Call count is high  
 Inbound usage of off net Helpline Voice Call count is high  
 Inbound usage of off net Evening Voice Call count is high  
 Inbound usage of off net SMS count is high

### Cluster 4

Inbound usage of off net Voice Call count is very high  
 Inbound usage of off net off peak Voice Call count is very high  
 Inbound duration of off net voice calls in evening is very high  
 Inbound usage of off net Voice Call count is very high  
 Inbound usage of off net Helpline Voice Call count is high

**High on net and off net Inbound Users**

# telenor Products Portfolio

## Call

### Off-net

### On-net

## SMS

## Internet

# Campaigns for Segments

## Out Bound Users

### Easy Card for Internet

- Rational
- Purpose for suggesting easy card is that they can be loyal customers.

## Internet Users

### Easy Card for Internet

### Weekly Bundle

- Purpose for suggesting easy card/weekly bundle for internet users is to encourage them to use start utilizing high speed 3G/4G internet.

## In Bound Users

### TELENOR GOOD TIME OFFER

- Purpose for suggesting TELENOR GOOD TIME OFFER offer will motivate inbound customers to use the on net minutes for their regular use.
